## THE ROUGAROU TUBE BASS PREAMP

### ABOUT

Developed to give bassists the ability to get the warmth and grit of a tube rig without requiring a back brace at the end of the night, the Rougarou Tube Preamp uses a sub-miniature triode tube to generate real tube overdrive, not solid state clipping or digital processing. This no-nonsense unit is extremely simple, and it features only two controls: a volume control and a bite (drive) control. Despite its simple nature, the Rougarou Tube Preamp is still extremely versatile and can do everything from adding warmth to full-blown distortion. The unit is touch sensitive, just like a tube rig, and a single setting can generate a variety of sounds depending on your attack. Whether you are using it to add grit to your sound or to simply give your lightweight amp some extra warmth, the Rougarou Tube Preamp is an excellent addition to any rig.

### SETTINGS

The Rougarou Tube Preamp features a **BITE** (drive) and a **VOLUME** control. The **BITE** control should be used to dial in the desired amount of overdrive. Once the **BITE** control has been set, the **VOLUME** control should be adjusted so that the level going through the pedal matches the level when the pedal is bypassed.

### POWER

The Rougarou Tube Preamp operates off of an 18V DC adapter. The AC adapter requirements are 18V DC with a minimum of 100mA output and a 2.1mm x 5.5mm connector with a negative center and positive outside.
